

Evaluation document of the developed prototype:

Johannes Bubeck, Janick Greinacher, Yannik Langer, Tobias Roth¹

¹ Hochschule Heilbronn, Master Wirtschaftsinformatik, {jbubeck, jgreina, ylanger, toroth}@hs-heilbronn.de

05.07.2023 - Version 2

Abstract

This document evaluates the extent to which the prototype developed as part of the research study is able to meet the requirements identified during the expert interviews.

Keywords:

evaluation, prototype, method selection assistant, technical factors, economic factors

1 Profile/User Selection

- Consultant (Pro-Version)
- User (Lite-Version)

Description:

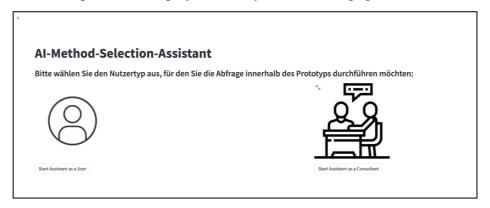

The user can choose between two profiles: the normal user and a consultant.

Modules:

- AI Method Selection Assistant
- Session_state

Screenshots:

1. Selection options are displayed directly on the home page

2. Feedback logged in as user

3. Feedback logged in as consultant

Result:

The requirement could be fully implemented.

2 User Input

Company / Organisation Data

Data Input

Description:

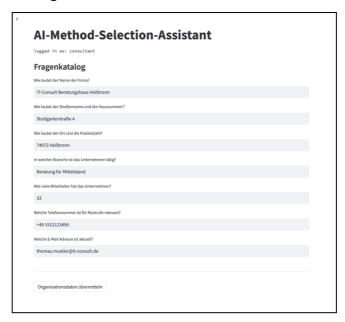

The user has the possibility to enter data via a mask. Here he has once the possibility to enter organizational data and data, for the consultation.

Modules:

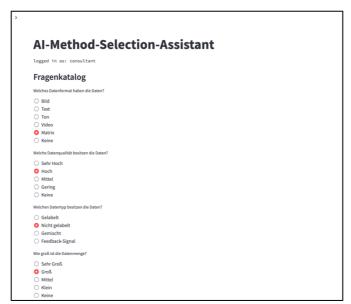

- Pages
- Forms
- Session_state
- Utils

Screenshots:

1. Input mask for organizational data

2. Input mask for the data basis on which the model performs the calculation. (part 1)

3. Input mask for the data basis on which the model performs the calculation. (part 2)

Result:

The requirement could be fully implemented, the user can enter the data individual via two masks.

3 AI-Method-Selection

- Calculation
- Model accessible

Description:

The assistant is able to calculate which methods would be suitable based on the model and the results.

Modules:

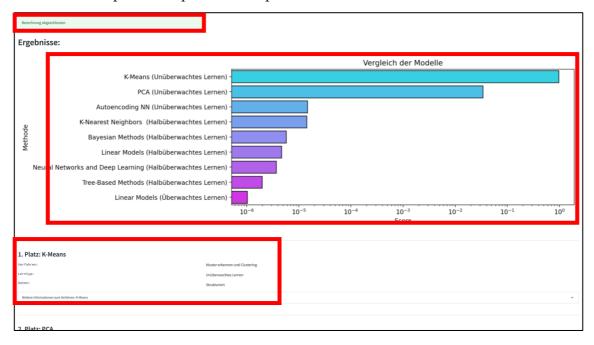

- Pages
- Session state
- Utils
- Model
- Result

Screenshots:

1. Summary of the result query and with the help of the button the calculation can be started

2. A descriptive chart and finally the descending order of the procedures is displayed with helpful descriptions of the procedures.

Result:

The requirement could be fully implemented, the user can perform the consultation himself with the help of the wizard and thus make the model usable.

4 Cost-Benefit-Analysis

• Calculation of the economic efficiency

Description:

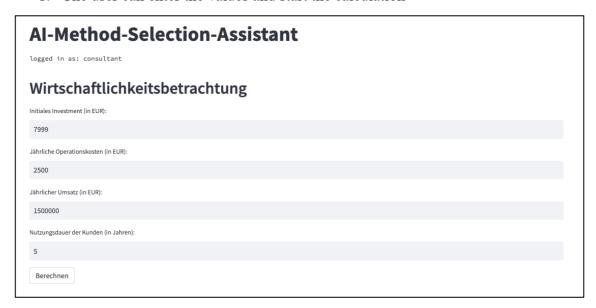

As a user, you can carry out the economic analysis of the procedures and problem definitions.

Modules:

- Pages
- Utils
- Session_state

Screenshots:

1. The user can enter the values and start the calculation

2. The calculation is presented.

Result:

The requirement could be completely fulfilled, the calculation is directly inside the consulting assistant.

5 Output of the results

- Ranking option (including dynamic selection of the number of results displayed)
- Graphics for visual presentation of the results

Description:

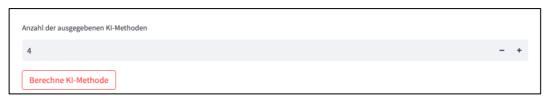

The results of the model can be dynamically differentiated on length and are presented in a graphically appealing way.

Modules:

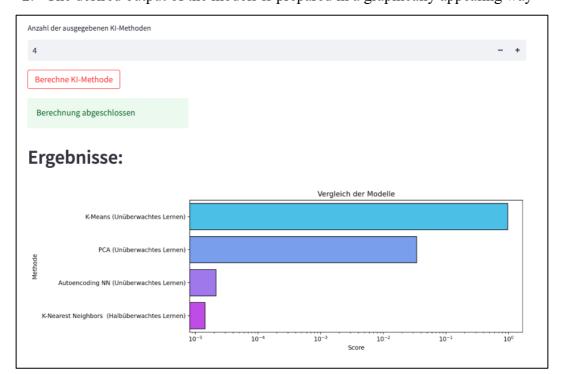

- Pages
- Session_state
- Utils
- Model
- Result

Screenshots:

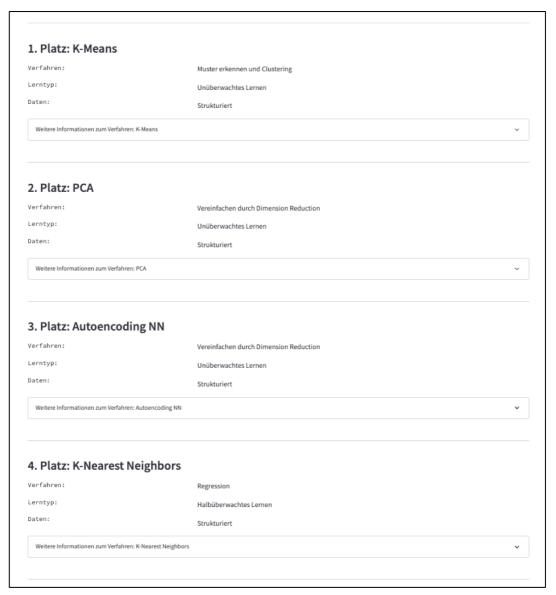

1. User can specify the number of desired output methods

2. The desired output of the models is prepared in a graphically appealing way

3. The desired output of the models is prepared in an appealing tabular form and it is possible to display additional information

Result:

The requirement could be completely fulfilled, the nuztzer can specify a number and accordingly a dynamic number of result will be output.

6 Saving:

- In the Asisstant
- Logging
- Extern in Dataframe

Description:

The request can be saved and viewed again in the assistant.

Modules:

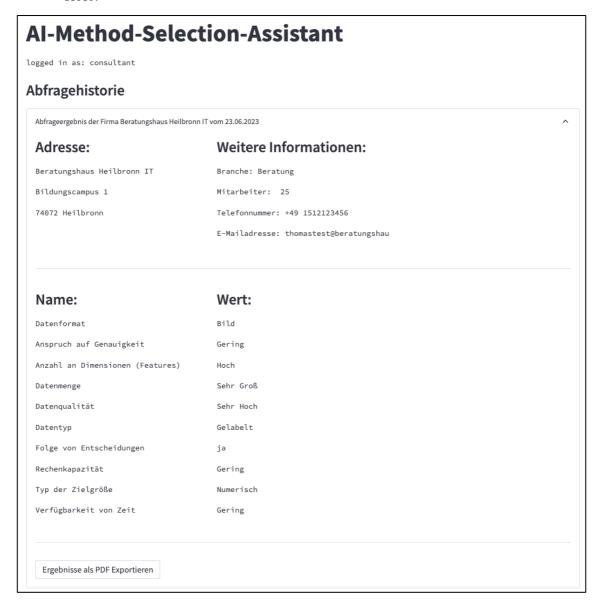

- Pages
- Session_state
- Utils
- History
- Result
- Assets

Screenshots:

1. With the help of the query history, the queries can be viewed.

2. The particular query can be examined in detail and the export of the query is possible.

Result:

The requirement could be fully implemented, all queries are available and displayed and it is also possible to output the respective PDF reports.

7 Analysis options

- Comparison of query results
- Feedback system, evaluation of output

Description:

The user is able to evaluate the query with the help of a feedback system.

Modules:

- Pages
- Session state
- History
- Result

Screenshots:

1. At the end of the survey, the user can indicate how satisfied he or she is with the rating.

Result:

The anofderung could be fully implemented.

8 Export

- Online-preview
- Export as pdf
- Sending E-Mail

Description:

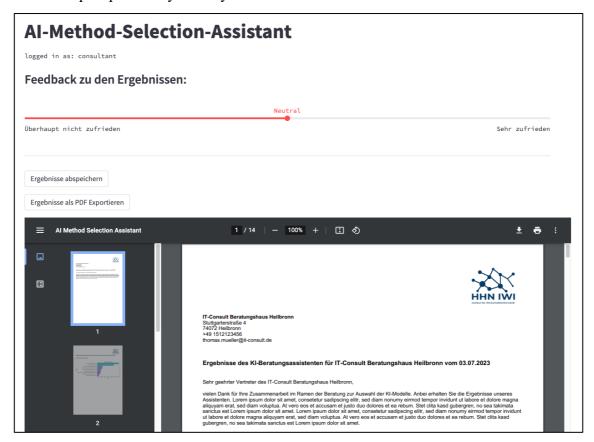

The query can be exported as a PDF. The PDF should be multi-page and contain all the information of the query.

Modules:

- Pages
- Report
- Result
- Session_state
- History

Screenshots:

1. Export possibility directly in the browser

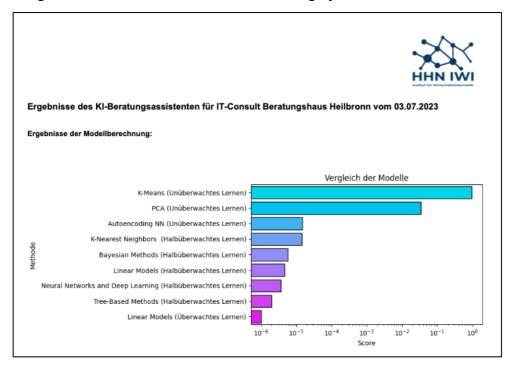

2. Extract from PDF Report document:

Page 1 Letterhead and Cover Letter

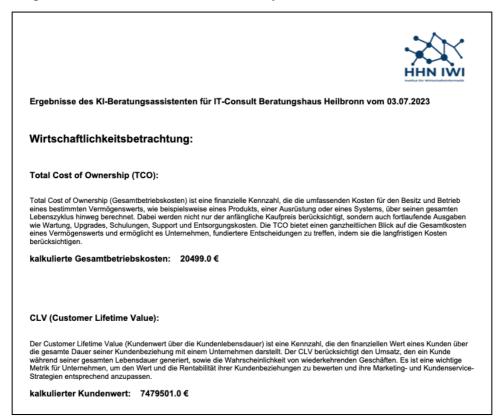

3. Excerpt from the PDF report document:

Page 2 Overview of the results and the clear graphical model

4. Excerpt from the PDF Report document:

Page 3 Result of the economic efficiency calculation

5. Excerpt from the PDF report document:

Page 4 Dynamic display of the contents in descending order of the results with indepth information on the models

Ergebnisse des KI-Beratungsassistenten für IT-Consult Beratungshaus Heilbronn vom 03.07.2023

Beste Methode: K-Means

Verfahren Muster erkennen und Clustering

Lerntyp Unüberwachtes Lemen

Daten Strukturiert

Beschreibung:

Die Verwendung des K-Means-Algorithmus erfordert eine konvexe Verteilung und ausgewogene Klassen in den Daten, um eine gute Performance zu gewährleisten. Jeder Cluster ist ungefähr ein kugelförmiger Globus im Hyperraum, die Globus sollen weit voneinander entfernt sein, und sie sollen alle ein ähnliches Volumen haben und sollen eine ähnliche Anzahl von Elementen enthalten.

Vorteile:
Der K-Means-Algorithmus ist tendenziell effektiv beim Clustering großer Datensätze und hat niedrige Rechenkosten und hohe Skalierbarkeit, was ihn für Big-Data-Aufgaben geeignet macht. Er kann seine Leistung bei größeren Datenmengen erheblich steigern.

Die Anzahl der Cluster muss im Voraus festgelegt werden. Die Verwendung ist auf eine bestimmte Datenkomplexität beschränkt. Sie kann generell mit komplexeren Datenverteilungen und mit unausgewogenen Daten nicht angemessen umgehen.

Aufgabentypen:

Zusätzlich zu den geringen Rechenkosten kann der K-Means-Algorithmus in vielen praktischen Situationen und Big Data Aufgaben gute Ergebnisse liefern, z. B. bei der Erkennung von Anomalien und der Segmentierung von Daten.

Result:

The requirements could be partially implemented. The export of the document could be fully implemented. However, it was not possible to send mail due to the lack of a technical mail server. However, this was already addressed at the beginning of the requirements analysis.
